

PRÄVENTION BEI KHK: SPORT, MEDIKAMENTE, DIÄT – WAS HILFT AM BESTEN?

PROF. DR. MED. CHRISTIAN MARC SCHMIED FACHARZT FÜR KARDIOLOGIE UND FÜR ALLGEMEINE INNERE MEDIZIN, SPORTARZT SEMS

DISCLOSURES

Consultancies and advisory board memberships

MSD, Pfizer, BMS, Amgen, Grünenthal, Bayer

Lecture fees and honoraria

MSD, Pfizer, BMS, Amgen, Sanofi, Servier, Edwards, Medtronic, Novartis, Daiichi Sankyo

Expert witness for a commercial entity

Boeringer Ingelheim, Astra Zeneca

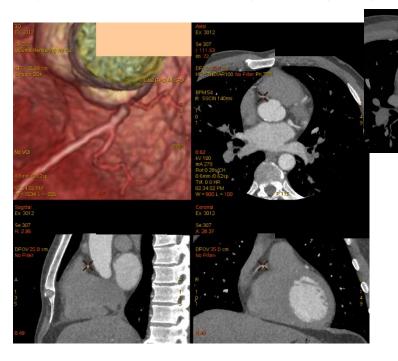

31 YEAR PRO ATHLETE

Asymptomatic, positive family history (CAD)

- Coronary calicification
- Non-stenotic coronary sclerosis with LMA, RIVA and Ramus marginalis plaques
- Perfusion-PET: no ischemia. Normal flow/perfusion reserve

Warum Sport nicht schlank macht

Viele populäre Vorstellungen zum menschlichen Stoffwechsel stimmen nur bedingt oder sind gar falsch. Wir überprüfen fünf gängige Mythen mithilfe neuer Forschungsarbeiten.

Sport treiben ist wichtig für die Gesundheit, auf die Gewichtsabnahme hat Sport aber kaum einen Einfluss. Foto: Getty Images

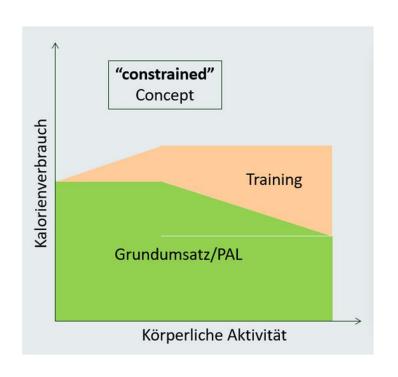

SONNTAGSZEITUNG

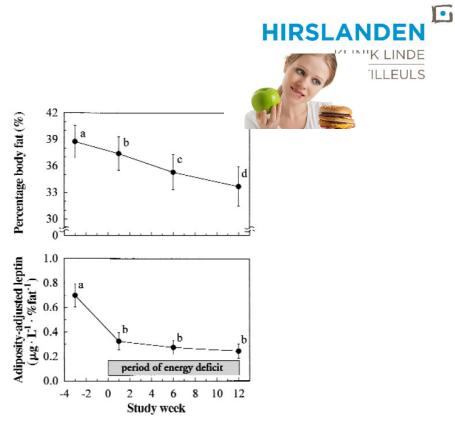

18.2.2023

Exercise and nutrition

Always go together!

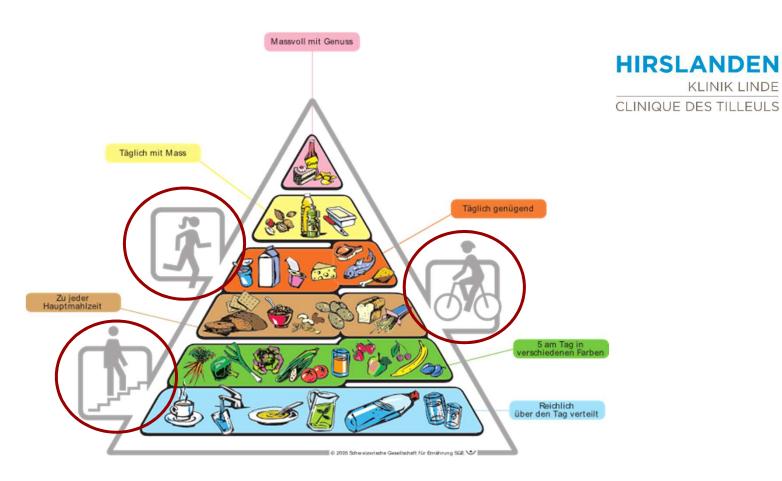

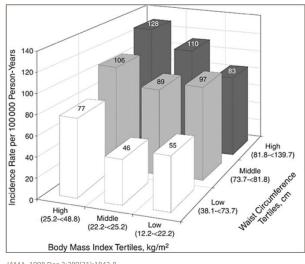

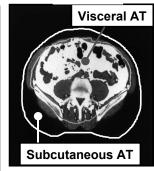

KLINIK LINDE

WAIST CIRCUMFERENCE

An independent but crucial risk factor

JAMA. 1998 Dec 2;280(21):1843-8.

DOES A "FAT BURNING" ZONE EXIST?

Free Fatty Acids (FFA)

AUC (μEq-min/I) 40000 30000 20000 10000

Before

All metabolic pathways work in synchrony!

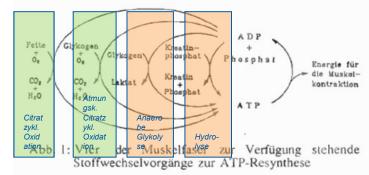

(Fat burning can occur at rest)

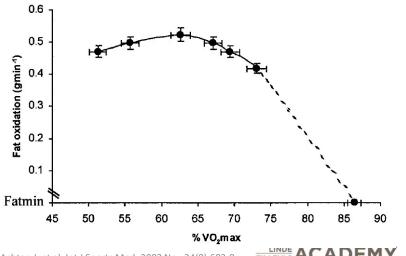

Exercise Program 4 weeks:

- Group A: aerobic cycle workout (2x/day 30 min; 6 days per week)
- Group B: aerobic cycle workout (2x/day 25 min) PLUS 5 min anaerobic workout)

Achten J, et al. Int J Sports Med. 2003 Nov;24(8):603-8.

"LIFESTYLE MANAGEMENT"

HIRSLANDE KLINIK LINDE CLINIQUE DES TILLEULS

Recommendations on lifestyle management

Recommendations	Classa	Levelb
Improvement of lifestyle factors in addition to appropriate pharmacological management is recommended. 119-122,124,148-153	ı	А
Cognitive behavioural interventions are recommended to help individuals achieve a healthy lifestyle. 181–183	L	А
Exercise-based cardiac rehabilitation is recom- mended as an effective means for patients with CCS to achieve a healthy lifestyle and manage risk factors. ^{151–153}	î	Α
nvolvement of multidisciplinary healthcare pro- essionals (e.g. cardiologists, GPs, nurses, dieti- cians, physiotherapists, psychologists, and pharmacists) is recommended. ^{121,123,181,184}	1	A
Psychological interventions are recommended to improve symptoms of depression in patients with CCS. ^{126,157}	Î	В
Annual influenza vaccination is recommended for patients with CCS, especially in the elderly, 175,176,178,179,185–187	1	В

Alter nicht Geschlecht beeinflussbar Familiäre Belastung Dyslipidämie **Diabetes mellitus** Übergewicht/vermehrter Bauchumfang Rauchen beeinflussbar Sedentarität **Ungesunde Ernährung** Distress Bluthochdruck

> Effect of potentially modifiable risk factors associated with myocardial infarction in 52 countries (the INTERHEART THE LANCET study): case-control study

Standardised case-control study of acute myocardial infarction in 52 countries (15'152 cases and 14'820 controls)

...in relation (odds ratios/PAR: *«population attributabe risk»*) to 9 cardiovascular risk factors

smoking, hypertension, diabetes, waist/hip ratio, dietary patterns, activity, alcohol consumption, blood apo-lipoproteins, psychological

Control of all 9 (influencable) cardiovascular risk factors leads to a reduction of 90 to 94%

of all heart attacks.

MUSCULAR SIDE EFFECTS OF STATINS

Fact or Fiction?

CTT meta-analysis of the effects of statins on muscle symptoms

Professor Colin Baigent on behalf of the CTT Collaboration Monday August 29th 2022

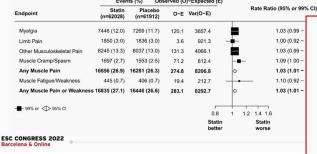

ESC CONGRESS 2022 Barcelona & Online

During the first year <u>only</u> <u>about 1 in 15 reported cases</u> of muscle pain or weakness were attributable to statin therapy.

Individual participant data meta-analysis of all recorded muscle symptoms in large-scale randomised blinded double-blind trials of statin therapy. Data from 23 trials from the Cholesterol Treatment Trialists' (CTT) Collaboration (155,000 patients)

ESC CONGRESS 2022 Barcelona & Online

Effect on muscle adverse events in trials of any statin regimen vs placebo

Relative and absolute rate differences for muscle pain or weakness, by duration of treatment, in trials of any statin regimen vs placebo

ASPIRIN IN PRIMARY PREVENTION

Recommendations	Classa	Levelb
Aspirin 75 - 100 mg daily is recommended for secondary prevention of CVD. ⁶¹⁹	I	Α
In patients with DM at high or very high CVD risk, low-dose aspirin may be considered for primary prevention in the absence of clear contraindications. 5,624,625	IIb	Α
Antiplatelet therapy is not recommended in individuals with low/moderate CV risk due to the increased risk of major bleeding. 624,626-630	ш	A

Ikeda Y, et al. Low-dose aspirin for primaryprevention of cardiovascular events in Japanese patients 60 years or older with atherosclerotic risk factors: a randomized clinical trial Stroke. 2016;47:1605-1611

Lancet 2004;364:937-52

Increased risk and worse prognosis:

- Depression RR 1.6 to 1.9
- Panic- and anxiety disorders RR 4.2 bzw. 1.3
- Schizophrenia: 1.5 times increased risk for cardiovascular disease

Caveat: Depression is an independent risk factor for (cardiac) medication malcompliance (risk doubled!)

Recommendations	Class ^a	Level	Ref
Multimodal behavioural interventions, integrating health education, physical exercise and psychological therapy, for psychosocial risk factors and coping with illness are recommended in patients with established CVD and psychosocial symptoms in order to improve psychosocial health.	1	A	242
Roferral for psychotherapy, medication of collaborative care should be considered in the case of clinically significant symptoms of depression, anxiety or hostility.	Ha	A	243, 244
Treatment of psychosocial risk factors with the aim of preventing CAD should be considered when the risk factor itself is a diagnosable disorder (e.g. depression) or when the factor worsens classical risk factors.	lla	E	245, 246

CAD = coronary artery disease; CVD = cardiovascular disease.

Lancet 2017; 390: 2643-54

SPORT IN THE (VERY) ELDERLY

KLINIK LINDE

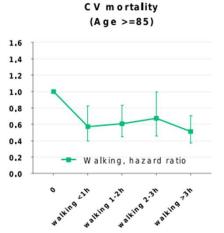

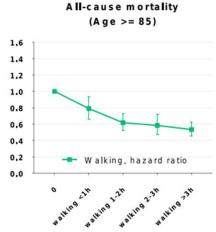

Association of usual walking with mortality in oldest old adults aged 85 years and older: a nationwide senior cohort study

Moo-Nyun J in, MD¹; Pil-Sung Yang, MD²; Hee Tae Yu, MD, PhD³; Tae-Hoon Kim, MD³; Hye Young Lee, MD, PhD¹; Hui-Nam Pak, MD, PhD³; Moon Hyoung Lee, MD, PhD³; Boyoung J oung, MD, PhD³
¹Division of Cardiology, Inje University College of Medicine, Seoul, Republic of Korea; ¹Division of Cardiology, CHA Medical Center, Seongnam, Republic of Korea; ¹Division of Cardiology, Yonsei University College of Medicine, Seoul, Republic of Korea;

Initially, only 538 participants (7.6%) met the guideline recommendations for physical activity. 1,037 (14.7%) participants with moderate intensity physical activity, 773 (10.9%) vigorous activity. Control of 1.997 participants who walked at a slow pace every week

Compared to inactive individuals, those who walked at least one hour per week had 40% and 39% lower relative risks of all-cause and cardiovascular mortality, respectively.

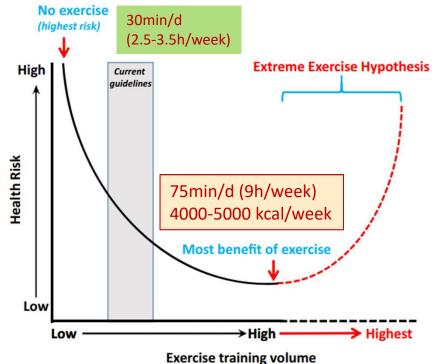

SPORT - THE MORE THE BETTER...?

Meta-analysis of prospective cohort studies evaluating the association of saturated fat with cardiovascular disease¹⁻⁵

Patty W Siri-Tarino, Oi Sun, Frank B Hu, and Ronald M Krauss

Background: A reduction in dietary saturated fat has generally been thought to improve cardiovascular health.

Objective: The objective of this meta-analysis was to summarize K of source be account to see and seed and and over the common or to see and a date of the color

fat to saturated fat (P:S), a hypothesis supported by a recent pooling analysis conducted by Jakobsen et al (24).

The goal of this study was to conduct a meta-analysis of welldesigned prospective epidemiologic studies to estimate the risk of the evidence related to the association of dietary saturated fat with CHD and stroke and a composite risk score for both CHD and

Stroke

Glycemic index, glycemic load, and chronic disease risk—a metaanalysis of observational studies^{1,2}

Alan W Barclay, Peter Petocz, Joanna McMillan-Price, Victoria M Flood, Tania Prvan, Paul Mitchell, and Jennie C Brand-Miller

ABSTRACT cereal products have replaced more traditionally processed

Gall bladder disease

+25 to 40 %

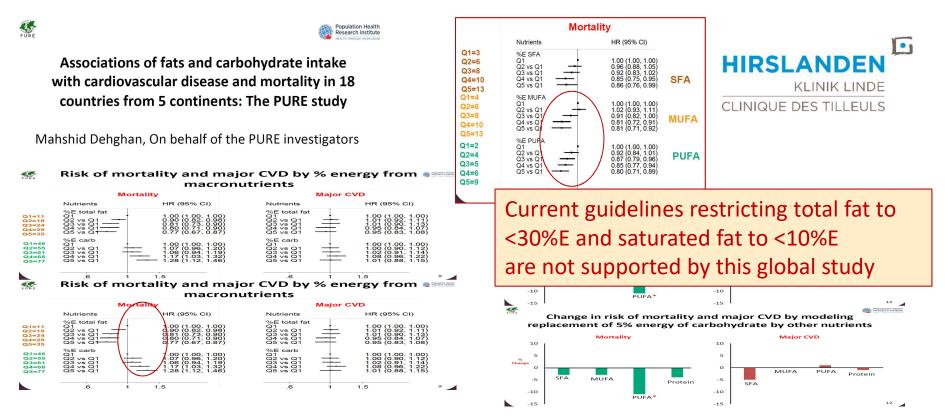

Diabetes type 2

+30 to 40 %

Cardiovascular disease +25 to 55 %

+10 to 15 % overall morbidity

- A high carbohydrate diet (>60%E) is associated with higher risk of mortality
- Higher intake of fats, including saturated and unsaturated fats, are associated with lower risk of mortality
- No association between total fat, types of fat and CVD events

CURRENT ESC RECOMMENDATIONS

It is recommended to adopt a Mediterranean or similar diet to lower risk of C.D. 403,404	1	Α
It is recommended to replace saturated with unsaturated fats to lower the risk of CVD. 405 – 409	1	A
It is recommended to reduce salt intake to lower BP and risk of CVD. 410	1	Α
It is recommended to choose a more plant- based food pattern, rich in fibre, that includes whole grains, fruits, vegetables, pulses, and nuts. 411,412	1	В
It is recommended to restrict alcohol consumption to a maximum of 100 g per week. ^{413–415}	1	В
It is recommended to eat fish, preferably fatty, at least once a week and restrict (processed) meat. 406,416 – 418	1	В
It is recommended to restrict free sugar consumption, in particular sugar-sweetened beverages, to a maximum of 10% of energy intake. 419,420	1	В

able 8	Healthy diet characteristics
Adopt a n	nore plant- and less animal-based food pattern
	fatty acids should account for <10% of total energy rough replacement by PUFAs, MUFAs, and carbohydrates from ins
	aturated fatty acids should be minimized as far as possible, with n processed foods
<5 g total	salt intake per day
30-45 g	of fibre of per day, preferably from wholegrains
≥200 g of	fruit per day (≥2−3 servings)
≥200 g of	vegetables per day (≥2-3 servings)
	should be reduced to a maximum of 350 - 500 g a week, in parocessed meat should be minimized
Fish is rec	ommended 1-2 times per week, in particular fatty fish
30 g unsal	ted nuts per day
Consump week	tion of alcohol should be limited to a maximum of 100 g per
Sugar-swe discourag	eetened beverages, such as soft drinks and fruit juices, must be ed
MUFA = m	onounsaturated fatty acid; PUFA = polyunsaturated fatty acid.

THE MICROBIOM

HIRSLANDEN

KLINIK LINDE

CLINIQUE DES TILLEULS

CONCLUSION I

- Sport, diet, pharmacological treatment it should not be asked which single therapy is best. The combination of all three therapeutic tools, varying in every individual situation, is most successful (in primary and secondary prevention).
- Tremendous evidence exists for an early and risk-dependent pharmacologic decrease of LDL-cholesterol, anti-diabetic therapy, as well as adequate treatment with psycho-pharmacological drugs, if indicated.
- Aspirin (in primary) prevention has to be outbalanced with a significantly increased bleading risk.

CONCLUSION II

- The lower «cut-off» for beneficial physical exercise is very low, but nevertheless, still seems to high for almost half of the Swiss population.
- Cardio-/Coronaro-protective nutrition is «mediterranean» and poor of carbohydrates (but relatively more fatty acids and proteins).

Caveat: The Mikrobiom!
